                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to nucleic acid molecule, designated CD2000 which encodes a polypeptide containing immunoglobulin [Ig] and Ig-like domains and SLMA associated protein (SAP) motifis. CD2000 DNA and protein is useful for treating disorder such as immune proliferative disorders. Immune disorders (e.g. carcinoma), viral infection, autoimmune disorders (e.g., arthritis, multiple solerosis, Grave's disease, and Hashimoto's disease), T cell disorder (e.g. arquired immune deficiency syndrome (AIDS)), inflammatory bowel disease (e.g. rheumatoid arthritis and osteoarthritis), allergic inflammatory disorders (e.g. sthma and psoriasis), allergic inflammatory disorders (e.g. sthma and osteoarthritis), allergic inflammatory disorders (e.g. suppredix disorders, septic shock, chronic obstructive pulmonary disease (e.g. emphysema), bronchitis, cachexia, jaundice, hepatic circulatory disorders, bepatitis, cirrhosis, cochexia, jaundice, hepatic circulatory disorders, pepatitis, cirrhosis, centermy CD2000 DNA is useful in screening assays, detection assays (e.g. chromosomal mapping, tissue typing, forensic biology), predictive medicine (e.g. diagnostic assays, prognostic assays, monitoring clinical trials and pharmacogenomical, The present sequence is human CD84 DNA
                                                                                                                                                                                                                                                                                                                                                                like domains and SLAM associated protein, termed CD2000 or CD2001, useful for treating immune, inflammatory, or hepatic circulatory disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     224

Human soft tissue sarcoma-upregulated DNA - SEQ ID 1885.

26-AUG-2004 (first entry)

```
relative to effector T cell function, or vice versa, in a subject. The method involves administering an agent that modulates the expression or activity of a molecule selected from PrGERS and TGFbetal, or Jagged-1, GPR-32, CD83, CD84, CD89, EPO-R, PSG-1, PSG-3, PSG-6, PSG-9, PDE-4d, and PI-stamine R-H4, GPRS, EPO-R, PSG-1, PSG-3, PSG-6, PSG-9, PDE-4d, and PI-related kinase to the subject, such that treatment occurs. The methods are useful for diagnosing, preventing or treating conditions characterized by a too-vigorous or weak effector T cell or regulatory T cell response to antigens associated with the condition, such as in an allergic response, an autoimmune disorder, a virsal infection, a microbial infection, a parasitic infection a tumour. The present sequence represents a DNA encoding a human leukocyte differentiation CD84 antigen, preferentially expressed in regulatory T cells.
from modulating the balance of regulatory T cell function

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a novel method for detecting soft tissue sarcome which comprises obtaining a first soft tissue sample from an individual and a normal soft tissue sample from the same or different individual, determining the expression of a gene in both samples and comparing the expression of the gene in both soft tissue samples, where a higher level of protein expression in the first soft tissue sample indicates the presence of soft tissue sarcoma. The method of the invention has cytostatic applications and may be useful for detecting soft tissue sarcoma, possibly via gene therapy or vaccine production. The nucleic acid sequences may be useful in diagnostic and screening applications. The current sequence is that of a human soft tissue sarcoma upregulated DNA of the invention. The current sequence is not shown within the specification per se but was submitted in CD format by the inventor.
                                                                                                                                                                                                                                                                                                                                                                                                                             Early detection of soft tissue sarcoma comprises determining expression of a gene in a first soft tissue sample and a normal soft tissue sample and comparing the gene expression, also useful in treating soft tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            BP; 315 A; 264 C; 238 G; 250 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                       This sequence represents a nucleic acid molecule designated Gene 164 from the human cDNA clone HSAWF26 (deposited as clone ATCC 97903 and ATCC 209049) which encodes a secreted human protein. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin FC portion (e.g. ANV59502) for increasing the stability of the fused protein as compared to the human protein only. The invention relates to protein as compared to the human protein only. The invention relates to 186 novel genes and their fragments (nucleic acid sequences: AAV59511-V59812; amino acid sequences AAW74731-W7526) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the presence of mutations in the new polyputcleotides.

Specific uses are described for each of the 186 polynucleotides, based on which tissues they are most highly expressed in (see AAV59511 for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  LysArgTyrAsnLeuGlnIleTyrArgArgLeuGlyLysProLysIleThrGlnSerLeu 120

```

The invention relates to an isolated protein that is one of 186 human secreted proteins, given in the specification, encoded by one of 309 cDNA contess also given in the specification. The protein is used in a pharmaceutical composition use perification. The protein is used in a condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. cardiac arrest, cerebrowascular disorders e.g. cardiac arrest, cerebrowascular disorders e.g. cardiac arrest, cerebrowascular disorders e.g. cardiac arrest, cerebrowascular disorders e.g. cardiac arrest, or packets and fungi and ocular disorders infections caused by bacteria, viruses and fungi and ocular disorders e.g. corneal infection. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sumburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The culture of primary tissues, to regenerate tissues and in chemotaxis. The components. The present sequence capabilities, fat content, lipid, protein, carbohydrate, vitamins, minerals, cofactors and other nutritional components. The present sequence represents a cDNA derived from a gene encoding one of the novel human secreted proteins of the invention. Note: This sequence did not form part of the printed specification, but was Ruben SM, Rosen CA, Fischer CL, Soppet DP, Carter KC; dednarik DR, Endress GA, Yu G, Ni J, Feng P, Young PE, Greene JM; Ferrie AM, Duan R, Hu J, Florence KA, Olsen HS, Ebner R, Brewer LA; Moore PA, Shi Y, Lafleur DW, Li Y, Zeng Z, Kyaw H; New isolated human secreted protein for diagnosing, preventing, treating or ameliorating medical conditions and used as a food additive or seqdata.uspto.gov/sequence.html?DocID=6420526B1 Example 1; SEQ ID NO 174; 129pp; English. The invention also discloses vectors, host cells, antibodies, and recombinant methods for producing human secreted proteins are useful for preventing, treating, sequences for the secreted proteins are useful for preventing, treating, ameliorating or diagnosing medical conditions such as hyperproliferative disorders (e.g. leukaemia or breast cancers), wounds, reproductive cisorders (e.g. leukaemia or breast cancers), wounds, reproductive cisorders (e.g. leukaemia or breast cancers), wounds, reproductive cisorders (e.g. wiskott-Aldrich syndrome or thrombocytopaenia), immunodeficiencies (e.g. wiskott-Aldrich syndrome or thymic hypoplasia), autoimmune disorders (e.g. graft-versus-host disease, will proplasia), autoimmune disorders (e.g. AlDS or sepsis), renal cisorders (e.g. kidney failure), cardiovascular disorders (e.g. angina disorders, cerebral ischaemia or congenital heart defects), respiratory disorders, neurological disorders (e.g. Crohn's disease). The parkinson's disease), and inflammations (e.g. Crohn's disease). The colymucleotide or polympetide may also be used as vaccine adjuvants. ACD82641-ACD8250 encode human secreted proteins or their fragments.                                                                                                              07-MAR-1997
  85\%
polypeptide, or its fragment, domain, epitope or species homologue; or a polynucleotide that hybridises under stringent conditions to any one of the sequences of (a)-(c). The nucleic acid is useful for preparing a medicament for diagnosing, preventing, treating or ameliorating a medical condition e.g., cancer. The sequence encodes a novel human secreted protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                           413

The invention relates to isolated nucleic acid molecules and the human secreted proteins (SPS) they encode. The proteins and nucleic acids may be used in the prevention, diagnosis and treatment of diseases associated be used in the prevention, diagnosis and treatment of diseases associated with inappropriate SP expression e.g. cancer, haematopoletic disorders, candocrine disorders, diseases of the immune system, inflammatory in disorders and many others. Full details of disorders that may be prevented, diagnosed and/or treated by the above methods are given in the specification. The nucleic acid molecules may be used to produce their proteins. The nucleic acid and it's complementary sequences may also be used as DNA probbs in diagnostic assays to detect and quantitate the proteins and the proteins and adaptatic acids in samples, and therefore which the proteins may be in need of restorative therapy. The SPS may also be used as antigens in the production of antibodies adainst the production of antibodies adainst the production of antibodies and activity. The anti-SP antibodies may also be used to down regulate expression and activity. The anti-SP antibodies may also be used as diagnostic agents for detecting the presence of the proteins in samples (e.g. by represents a human secreted protein CDNA). The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             isolated nucleic acid molecules encoding human secreted proteins, useful for preventing, diagnosing and treating disorders associated with

The present invention relates to PRO proteins and their coding sequences.

The PRO proteins are useful for diagnosing and treating a B cell related disorder, e.g. X-linked infantile hypogammaglobulinemia, polyasaccharide antigen unresponsiveness, selective IgA deficiency, selective IgA deficiency, selective IgA deficiency, selective IgA deficiency, Burkitt's hypogammaglobulinemia of infancy, Burkitt's lymphoma, intermediate lymphoma, follicular lymphoma, type II hypersensitivity, rheumatoid arthritis, autoimmune mediated heemolytic anaemia, myasthenia gravis, hypodremocorticism, glomerulonephritis, or anaemia, myasthenia gravis, hypodremocorticism, glomerulonephritis, or anaemia, myasthenia gravis, hypodremocorticism, glomerulonephritis, or anaemia, myasthenia gravis hypodaremocorticism, glomerulonephritis, or cancer or immune-mediated inflammatory diseases. The PRO coding sequences are useful as hybridization probes in chromsome and gene mapping, in preparing PRO proteins, or in generating transgenic animals or knockout animals, which in turn are useful in the development
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   167
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              407

```
The invention relates to a novel isolated nucleic acid and the PRO
polypeptide encoded by it. A protein of the invention has
reliable interarchy, antiarthritic, antichematic, immunosuppressive,
cartinifiammatory, antiarthritic, antipsoriatic, antiallergic,
cateopathic, antidiabetic, dematological, antipsoriatic, antiallergic,
cateopathic, antidiabetic, and respiratory activity. A polynucleotide
contist, invention may have a use in gene therapy. The PRO polypeptide, its
cateomist, antagonist, or antibody that specifically binds to the
polypeptide is useful for treating an immune related disorder such as
systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis,
invenile chronic arthritis, a spondyloarthropathy, systemic
cystemic inflammatory myopathy, Sjogren's syndrome, systemic
chrombocytopenia, thyroiditis, diabetes mellitus, immune-mediated renal
chisease, a demyelinating disease of the central or peripheral nervous
cystem, idiopathic demyelinating polyneuropathy, Gulllain-Barre syndrome,
a chronic inflammatory demyelinating polyneuropathy, a hepatobiliary
cdisease, infectious or autoimmune chronic active hepatitis, primary
bliary cirrhosis, granulomatous hepatitis, sclerosing cholangitis,
                                                                                            587

                                                                                                                                                                                                                                                                                                                                                          Diagnosing susceptibility to schizophrenia (SCZ) in a patient, by determining presence or absence of an allele of a linked polymorphic marker present on chromosome 1q22, were the marker is linked to a variant form of the SCZ gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence was isolated using the method of the invention as the SCZ gene. This sequence has been previously identified as CD84, GenBank Accession No: NM 008874. CD84 is a 73 kDa antigen present on platelets, monocytes and circulating B cells. The proteins encoded by this sequence may be involved in the processes by which the brain responds to hiological stimuli. Therefore they may provide targets for therapeutic intervention in the treatment of Schizophrenia. The SCZ sequence may be used in a new method of diagnosing susceptibility to schizophrenia in a patient. The method comprises determining the presence or absence of an allale of a linked polymorphic marker in the DNA of the patient. The polymorphic marker is present in chromosome 1922 and is linked to a gene (SCZ) having a variant form associated with a phenotype of schizophrenia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           orphic marker is present in chromosome 1922 and is linked to a gene
having a variant form associated with a phenotype of schizophrenia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               LysAspSerGluIlePheThrValAsnGlyIleLeuGlyGluSerValThrPheProVal

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a novel method for detecting soft tissue sarcoma which comprises obtaining a first soft tissue sample from an individual and a normal soft tissue sample from the same or different individual, determining the expression of a gene in both samples and comparing the expression of the gene in both soft tissue samples, where a higher level of protein expression in the first soft tissue sample indicates the presence of soft tissue sarcome is may be useful for detecting soft tissue sarcoma, possibly via gene therapy or vaccine production. The nucleic acid sequences may be useful in diagnostic and screening applications. The current sequence is that of a human soft tissue sarcoma-upregulated bNA of the invention. The current sequence is not shown within the specification per se but was submitted in CD format by the inventor.

                                                                                                                                                                                                                                                                                                            Homo sapiens
                                                                                                                                                                                                                                                                                                                                                                                               18-MAR-2004
                                                                                            ADL57104;
                                                  RESULT 14
                                                                       The invention relates to an isolated polypeptide (I) associated with breast cancer which is encoded by a nucleic acid molecule comprising a nucleotide sequence (S1). Further disclosed is an antibody that binds to the polypeptide of the invention. The activity of the polypeptide of the invention may be described as cytostatic. The antibody is useful for detecting the presence of (I) in a sample. Nucleic acid molecules of the invention are useful in the detection of breast tumours. (I) is useful as a marker for breast cancer and in breast cancer therapy. Sequences given in records ACN/8851-ACN/9294 represent nucleic acid markers associated with breast cancer. Note: The sequence listing does not form part of the specification but may be obtained in electronic format from the USPTO web site at seqdata.uspto.gov/sequence.html?DocID=20030099974
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        LysAsnValThrTyrAsnTrpSerProLeuGlyGluGluGlyAsnValLeuGlnIlePhe 160

The invention relates to a novel isolated polypeptide (NOVX) comprising a mature form of any of the 37 amino acid sequences fully defined in the specification. A polypeptide of the invention has antidiabetic, anorectic, cardiant, hypotensive, antiarteriosclerotic, anorectic, virucide, antibacterial, fungicide, protozoacide, nootropic, neuroprotective, antiparkinsonian, anticonvulsant, osteopathic, antiarthritic, antiarthritic, antiarthritic, antiarthritic, antiarthritic, antiarthritic, and antilpaemic activity. A polypotide of the invention may have a use in gene therapy. The polypeptides, nucleic acid molecules and antibodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ds; gene; human; antidiabetic; anorectic; cardiant; hypotensive; antiarteriosclerotic; anorectic; virucide; antibacterial; fungicide; protozozoaide; nootropic; neuroprotective; antiparkinsonian; protozozoaide; nootropic; antiarthritic; antiinflammatory; dermatological; antiasthmatic; antilipaemic; gene therapy; flbroblast growth factor receptor 4; FGFR4; complement factor i precursor; matrix metalloproteinase-15 precursor; MDC3; T-lymphocyte surface antigen Ly-9 precursor; flbroblast growth factor-21; FGF-21; antibha-2 macroglobulin-like polypeptide variant; antibekoproteinase 1 precursor; LiV-1; nuclear hormone receptor NOR-1; transmembrane protein-like; beta-necendorphin-dynorphin precursor.

are useful in the manufacture of a medicament for treating a syndrome associated with a human disease, preferably a NOVX-associated disorder.

The nucleic acid molecules, polypeptides and antibodies are useful for treating, preventing or diagnosing diseases such as metabolic disorders, diabetes, obesity, infectious diseases such as metabolic disorders, diabetes, obesity, infectious diseases (Viral, bacterial, fungal, helminthic, and protozoal), anorexia, cancer, cardiovascular diseases (Kypertension, atherosoclerosis), neurodegenerative disorders, Alzheimer's disease, pellepsy, immune disorders Alzheimer's constitution, and various dyslipidaemias. The nucleic acids and polypeptides cathma, and various dyslipidaemias. The nucleic acids and polypeptides cathma, and various dyslipidaemias. The nucleic acids and polypeptides cathma, heamatopolesis, wound healing and andjoagenesis, in generation of antibodies that bind immunospecifically to NoVX substances for use in therapeutic or diagnostic methods. The nucleic cades are further used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine, and pharmacogenomics. The NoVX collections in NoV1a-1t show homology to cibroblast growth factor receptor (FGFR4); NOV2a shows homology to fibroblast growth factor receptor (FGFR4); NOV3a shows homology to fibroblast growth factor seceptor (FGFR4); NOV3a-7c show homology to fibroblast growth factor seceptor (FGFR4); NOV3a-7c show homology to fibroblast growth factor seceptor (FGFR2); NOV3a-7c show homology to fibroblast growth factor cecptor collypeptide variant; NOV9a-9s show homology to the present sequence on codes a NOV9 or shows homology to consider the present sequence encodes a NOVY or transmembrane protein-like; NOV12a-12c show homology to beta-necendorphin precursor. The present sequence encodes a NOVX polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          the invention.

The invention relates to a novel isolated immune response associated protein (IRAP) comprising any of 35 fully defined sequences given in the specification. The polypeptide of the invention demonstrates of antiatreriosclerotic, cytostatic, neuroprotective, antiparkinsonian, hepatotropic, cerebroprotective, antiinflammatory, nootropic and vasotropic activities and may be useful for treating a disease or condition associated with decreased expression or overexpression of functional immune response associated proteins, while the antibody is useful for diagnosing a condition or disease associated with the expression of IRAP, such as arteriosclerosis, cirrhosis, cancer, stroke, Alzheimer's disease, Parkinson's disease and Crohn's disease.

C Purthermore, the molecules of the invention may be utilised during gene therapy procedures. The current sequence is that of a human IRAP cDNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated immune response associated proteins (IRAP) polypeptide and polymucleotide, useful for diagnosing and/or treating disorders with aberrant expression of IRAP, such as arteriosclerosis, cirrhosis, cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       TW;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
